EDUCATION

Muffakham Jah College of Engineering and Technology, Banjara Hills, Hyd.

Bachelor of Engineering Information Technology, May 2027

GPA: 8.1

Additional Courses: CS50: Introduction to Computer Science, Harvard University; Machine Learning Specialization - Andrew Ng (Coursera)

TECHNICAL SKILLS:

- **Languages:** Python, SQL, JavaScript.
- **ML/Data:** Computer Vision (OpenCV, YOLO), Gen AI (RAG, LLMs), PyTorch, Scikit-Learn, Pandas, NumPy, XGBoost, LightGBM, CatBoost, PuLP (integer programming)
- **Modeling & Evaluation:** Feature engineering, backtesting, baseline comparison, error analysis, small-sample shrinkage
- **Frameworks/Tools:** FastAPI, Node.js, Express, Docker, Git
- **Cloud/DB:** Google Cloud (GCP), AWS (S3), Hugging Face Spaces, Render, PostgreSQL, SQLite, ChromaDB

WORK EXPERIENCE

IBM SkillsBuild Data Analytics Internship, CSRBOX

Data Analytics Intern, June 2024-August 2024

- Achieved **1st place** out of 123 teams (29,347 students) in a national-level challenge to develop a Road Accident Prediction Model.
- Analyzed and engineered features from crash incident data, correlating weather, time of day, and road characteristics to incident severity.
- Collaborated with 4 other students to develop a Road Accident Prediction Model for Safer Urban Transportation, utilizing machine learning to map out high-risk areas.

Google Developer Student Club, MJCET, Banjara Hills, Hyd.

Artificial Intelligence and Machine Learning Core Team, December 2023-July 2024

- Developed an Ad Recommendation model which utilized machine learning to estimate users' purchase preference. Collaborated with a team to organize Google club events across campus.

PROJECTS

Glory Hunter, *An expected-points prediction and squad-optimization system for Fantasy Premier League*, August 2026 - Present

- Engineered an expected-points model over ~600 Premier League players — EWMA form, minutes reliability, xG/xA per-90, and Poisson-tail defensive-contribution rates — each shrunk toward positional priors so small-sample features cannot dominate the blend.
- Built a pre-deadline prediction log and backtest harness scoring the model on paired MAE, Spearman, and top-20 precision against two baselines (FPL's own expected points and a constant-zero control), gating verdicts to ≥ 5 gameweeks to avoid calling a win on correlated within-gameweek samples.
- Formulated squad and transfer selection as an integer linear program (PuLP/CBC) over a 5-gameweek discounted horizon, encoding budget, formation, 3-per-club, and -4 transfer-hit costs directly as constraints and decision variables.
- Deployed as scheduled GitHub Actions jobs (Flask, SQLite, state versioned in git) that capture each deadline's projection and backfill actuals after matches — ~38 captures per season with no always-on host.

SkillsSeekho, *An AI-powered voice-first hyperlocal marketplace* | Secured 2nd Place at HACKPRIX, June 2026

- Engineered a multilingual speech-to-text pipeline that routes English queries to Groq Whisper (whisper-large-v3-turbo) and transcribes 9+ Indian regional languages (Hindi, Telugu, Kannada, etc.) using Sarvam AI (saarika:v2.5).
- Developed a structured intent-extraction engine using Llama-3.3-70B to parse raw voice transcripts, mapping unstructured conversational speech directly into validated JSON schemas for search queries, listing details, and user profiles.
- Built a voice-interactive chatbot (SkillBot) powered by the Sarvam-105B LLM, integrating microphone-based Speech-to-Text (saaras:v3) and Text-to-Speech (bulbul:v3) to enable real-time, hands-free guidance in both Hindi and English.

SmartMonitor, *A real-time spatial analytics web application*, April 2026

- Engineered a computer vision pipeline using YOLOv11 and OpenCV to track human movement and detect threshold crossings across user-defined polygonal boundaries.
- Developed automated spatial logic to compute trajectory intersections, reliably logging unique entry/exit events into a SQLite database for analysis.
- Built and deployed an interactive frontend using Streamlit and Docker on Hugging Face Spaces, enabling users to upload video feeds and draw custom Regions of Interest (ROI).

PESO, *A predictive financial safety system*, November 2025

- Engineered a predictive risk engine using XGBoost to quantify financial stability (0-100 score), effectively capturing non-linear debt thresholds for irregular income earners.
- Developed a Retrieval-Augmented Generation (RAG) chatbot using ChromaDB and OpenAI to provide context-aware financial coaching, grounding advice in verified protocols to prevent hallucinations.
- Built and deployed a high-availability REST API using FastAPI and Docker on Google Cloud Run (GCP) to serve real-time risk predictions and chat responses.
